A Rescheck in building consists of two seperate parts. First, you have a calculation page which will measure your residential construction projects compliance against your local code and climate zone. This area takes into consideration all the components of your home and places them into an easy to read report with a pass or fail grade. The second part of the Rescheck in a residential building application is the checklist. This compliance checklist is typically 6-12 pages and allows your building inspector or building department to easily review your structure once it is constructed. Sometimes they even place a certificate on the breaker box to show you complied. What we do for residential construction Reschecks is complete all 3 items for one low cost of $79. What you get with this is the highest level of customer service, a lightning fast turn around, and the best Rescheck report available anywhere. If you have questions about a Rescheck report we would be glad to consult with you free of charge.
